

MR3PS

MR3PS - 4.5 Internet Filter Software for Microsoft Proxy Server

MR3PS-4.5 for Microsoft Proxy Server is the latest Internet access management solution for MS-Windows NT Server and Windows 2000 Server. It is ideal for businesses and schools and provides a tool for preventing access to non-work related and inappropriate Internet sites. MR3PS is provided with a PTD-Computer Patrol Computer System (additional cost) built for your business, or combined with your existing equipment.

Features & Benefits - Internet Access Management

- **Web/ FTP** - MR3PS-4.5 helps administrators manage access to Web sites (HTTP) and file transfer (FTP) requests through Web Browsers that lead to non-work related or offensive sites.
- **Search Engine** - MR3PS-4.5 prevents using keywords on search engines that lead to inappropriate material.

Direct Address Identification (DAI)

MR3PS-4.5 was the first access management product based on direct address identification (DAI), which sets user access privileges based on pre-set URLs and IP addresses. MR3PS-4.5 has the most comprehensive database of content-specific URLs and IP addresses available, which is updated 24/7 by powerful automated processes, supported by human verification of content classification.

Create Your Own Categories

Administrators can create their own categories of unwanted sites ("black list") or permissible sites ("white list"). MR3PS-4.5 also allows administrators to import from a list of pre-existing sites into these categories.

User / Group Profiles

MR3PS-4.5 allows administrators to select different Internet access criteria for individuals or groups of users. For example, the marketing department can only have access to shopping sites while the accounting department only has access to financial sites.

Internet Usage Reports

The MR3PS-4.5 Internet usage reporting system gives administrators a tool to produce reports on users' Internet activities. The reports include user IP addresses and user names, sites visited, times and duration of visits and site categories such as porn, sports, news, etc.

Time Setting

With MR3PS-4.5's time control setting, administrators can assign specific time(s) of the day to allow users to gain access to restricted Internet sites. For example, an administrator may choose to allow access to shopping sites during lunchtime or after hours.

Key Benefits:

- **PTD-Computer Patrol Supported Product**
- **Block or Monitor URLs:** Prevent users from accessing sites with offensive or unwanted content
- **Search Engine Monitor:** Allows for an optional setting that blocks words at the search engine level which are commonly used to find pornographic or other unwanted content
- **Custom Management:** Allows IS managers to add or delete sites from the master database or add or delete words to the Search Engine Monitor
- **Automatic Updating:** Updates itself automatically with the latest blocked sites-while keeping all the custom settings made by an IS manager

System Requirements:

- 64 MB memory
- 256 MB of free hard drive space
- Microsoft Task Scheduler Service
- Microsoft Internet Explorer version 2.0, 4.01 and service pack 4 or higher
- MR3PS-4.5 is fully compatible with IIS 4.0 on Windows NT and IIS 5.0 on Windows 2000
