"I.T. can get complicated, but our Pros

make it easy...for YOU."

Jaime Mendes
V.P. of Operations, PenTeleData

Backup Recovery Testing

Confirming your data Is ready to go in the event of a disaster

Valid backups are the bedrock of a robust business disaster recovery and business continuity strategy.

Regular, automated backups are critical. If they have not been tested and validated, you may not know your backups are available and ready when it counts.

Our team's backup recovery testing solution offers regular automated test recoveries of your most critical data.

> Save recovery time in a local data loss scenario

> Gain peace of mind your backups have been tested

> View reports featuring screenshot verification of backups

> Test comprehensively across system state-, file-, and folder-backups

> Have backups ready to use when you need them the most

Automatically test backup recoverability

We will test Your Windows® servers in the recovery testing plan automatically every 14 or 30 days, depending on your organization's needs.

How backup recovery testing works

> We spin up a testing environment in the cloud, restore your backup, and take a screenshot to verify successful recovery

> We delete the cloud testing environment after the test

> We generate an accessible report confirming the successful backup test
